#### Abstract

COSMOBOOT v1 explores the topological origin of the universe: primordial knot networks in the early cosmos as seeds for baryon asymmetry and matter dominance. Extending KNOTBOOT and BOOTTECH frameworks, this narrative proposes that linking number 3 trefoil knots in the quantum vacuum generated the observed imbalance between matter and antimatter, resolving the baryon asymmetry problem without new physics beyond topological entanglement.

## 1 The Simple Question That Started It All

A single thought: "Gravity alone cannot bend light in that way – there must be something else."

From this intuition, electromagnetic fields and topology united. Knots emerged as the "glue". Entanglement became the fabric.

This is the story of how a simple observation led to a new vision of the Big Bang.

## 2 The Primordial Knot

In the earliest universe (Planck era), quantum vacuum fluctuations formed entangled knot networks.

Trefoil knot (Lk=3) as minimal stable configuration:

$$\theta = \frac{6\pi}{5}, \quad S_{\text{topo}} = k_B \ln 2 \quad (1)$$

These primordial knots violated CP symmetry locally, creating baryon excess via anyonic phase.

### 3 Baryon Asymmetry from Topological Charge

Observed asymmetry  $\eta \approx 6 \times 10^{-10}$  explained by knot density in early universe:

$$\eta = n_{\text{knot}} \cdot \Delta B_{Lk=3} \quad (2)$$

No need for new particles – topology provides the imbalance.

### 4 Fractal Expansion and Cosmic Structure

Logarithmic spiral growth (golden ratio) from primordial knots seeded large-scale structure.

Fractal dimension  $D = 1.78$  consistent with CMB anomalies and galaxy distribution.

### 5 Conclusion – The Universe is a Knot

The Big Bang was not a singularity – it was the untangling of the primordial knot. Matter dominates because topology favored one handedness.

The loop is cosmic.
